

Forklift Fork Positioners

Fork Positioner for Forklift - A fork positioner is an apparatus constructed out of high quality materials designed to be able to endure the most challenging operations and work environments. This particular piece of equipment could enable the one driving to be able to work the forks hydraulically without leaving the seat. Side shifting models have the extra ability to laterally position the entire load or the arms so as to facilitate more precise carrying and placement in a faster and much more effective manner.

The only one of its kind blade pocket design could enable the person operating it to safely sway the unit's blades without any fear of destroying the positioning cylinders. This could allow the worker the option to either perform simultaneous or independent fork movement, dependent upon the requirements of the job. For most lift trucks with non-OEM carriages, complete carriages are necessary. Standard OEM carriages can be converted into fork positioners on existing units.
